

This is the opening paragraph of the plain text fixture. It describes the northbound migration of the quokka population across the veldt, a journey marked by distinctive foraging patterns and communal nesting behaviour. The sentences should wrap naturally across the full measure of the text block so that the PDF inspector's text extraction returns ordinary prose rather than structured markup. This paragraph deliberately contains no headings, no lists, and no emphasis commands of any kind, ensuring that it stays plain text from start to finish. Filler words about weather, soil, and seasonal herbivore movement fill out the rest of this page so that extraction has real prose to work with.

This second page continues the prose-only fixture. Among the observations recorded here is the distinctive term `plaintextsentinel-foxtrot`, which is used only once in this document so that automated tests can assert that it appears verbatim in the extracted content. The remainder of this paragraph is deliberately generic filler prose about rainfall, drainage, and the gradual retreat of the frost line. No structure is introduced here either; the text remains a sequence of unformatted paragraphs with nothing but a page break separating it from its neighbours.

The third and final page closes out the plain text document. It carries the unique marker `plaintextsentinel-golf` so that a test can verify that text spanning the third page is captured. A closing remark reiterates that this fixture is intentionally plain: paragraphs only, with pagination controlled by explicit page breaks and no visual formatting beyond the article class defaults. With this closing sentence the plain text fixture reaches its end.
